Additional Information PROJECTS Databases and Web Applications Project Developed a web application for navigating through a database of movies to replicate a real-world e-commerce website such as being able to browse, search, and checkout movies Applied reCaptcha to the login page to ensure the security and integrity of all user s information/ prevent bad requests Implemented connection pooling which allowed our application to cache database connections and

reused the database connections when future requests are made    Deployed and ran the Maven project onto Tomcat and AWS EC2 web servers    User Interface Software    Created an authentication and authorization flow to gather info from Spotify API by requesting access tokens and refreshing the expired tokens using the fetch command    Injected Spotify service to retrieve and display all tracks, albums and artist information using Angular loops to display features such as carousels, track lists and thermometers    Used Express for the backend server to handle authentication via OAuth, which allowed to communicate with the Spotify API
