Software Developer Software Developer Software Engineer/Project Manager Pasadena, CA I am a strong back-end software developer who has built complex software applications and data pipelines. Recently, I had the opportunity to manage an offshore development team leading 9 projects into productions in less than 6 months. I helped improve internal communication between departments and increase accountability by combining JIRA ticketing and Slack messaging into a platform where the company's processes are increasingly evolved around.   Software Development Experience   I designed and coded applications for the sales and accounting departments. These programs process and parse data feeds from multiple external sources such as Google, YouTube, DoubleClick, and Appnexus using their APIs.   I increased performance and reduced run time by multi-threading these parsing processes. I wrote RESTful web services using authentication. The team used an Agile approach to development, and conducted regular stand-up meetings to track progress. Our team had several successful deployments with minimal errors, and was recognized as one of the highest quality and most productive in IT. Authorized to work in the US for any employer

Work Experience Software Developer Self-Employed - Pasadena, CA April 2018 to Present Building an E-commerce website with Django, Stripe, Celery, and Docker.
